

## Copying data from Old PC to the thin-client based VM

### Read this before proceeding:

1. Normally, in the case of replacement of old PC with new thin-client, the IP address used in the thin-client is the same as that of old PC. In that case, once the thin client is made operational, the old PC has to be disconnected from the network.
2. For this procedure to work the Old PC needs to be given a temporary IP and connected to the network. For getting a temporary IP, users are requested to contact the local network coordinator.

### Accessing User's personal drive from Old PC(After assigning temporary IP)

1. All the thin client users have a storage drive for saving user data. This is named as **My Personal Drive(H: Drive)** in the thin client
2. This same location can be accessed *from the old PC* by following the below steps:
  - a. Open **My Computer(Windows Explorer/File Browser)** and type \\10.29.1.253\profiles\$\<thin-client-loginID> in the Address bar and press **Enter**
  - b. This will open a pop up window to enter UserName/Password

- c. Enter Username as **VDIDOM\<thin-client-loginID>** (Example: **VDIDOM\igc99999** )
  - d. For password enter **thin client login password** and press **OK**.
3. Now you may copy any data from your Old PC to the this location
  4. Lastly login to the thin-client, **press Ctrl+Alt+Del** and change the password
